ZT Safety Harness

How it works

1. The ZT Safety Harness is shown as fitted and worn for work, with front point attachment and carabiner shown here in stowed position.

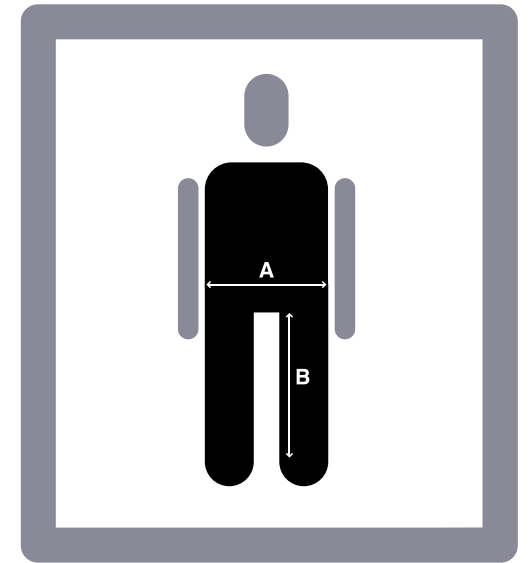

2. Here the trouser unit has been removed to expose the leg lanyard and calf gaiter. In the event of a fall the front point attachment pulls and clenches the calf gaiter.

3. The exposed calf gaiter shown here.

2. In the event of a fall the calf gaiter clenches, pulling on the fronts of the legs, the fall forces are distributed evenly on the body pulling it into a seated position. The bodies resistance to this action help to absorb some of the fall forces, further reducing risk of trauma.

When ordering harness, please ensure waist size A is measured around the the tummy NOT the hips. As a guide this should be at least two inches greater than that which you normally regard as your waist size.
